

## Measurement and diagnostic technology – rail depot measuring and testing equipment

### Testing equipment for brake shoes

The rail depot measuring and testing equipment 5500.5 is used to test the functional characteristics on the brake shoe.

- Utilisation of the maximum mileage of the brake shoe (CBM)
- Convenient determination of characteristics in complex geometries

#### Technical details

- For measuring length and angular dimensions
- Mechanical design without digital elements
- Very robust structure for use in workshops
- User-friendly and can be used without extra training
- Convenient determination of characteristics in complex measuring geometries
- Simple mechanical structure
- The characteristics to be determined are shown directly in the design structure in compliance with standards and regulations
- Produced and tested in accordance with guidelines
- Made from hardened gauge steel
- Any shape and dimension combination possible without incremental costs or redevelopment
