

Measurement and diagnostic technology – rail depot measuring and testing equipment:

## Distance measurement device between switch blades and stock rail web

The rail depot measuring and testing equipment 5573.513 is used to measure the distance between the switch blades and the stock rail web. It offers a convenient determination of characteristics in complex measuring geometries

### Technical Details:

- Measurement of length dimensions
- Mechanical design without digital elements
- Very robust structure for use in workshops
- User-friendly and can be used without extra training
- Convenient determination of characteristics in complex measuring geometries
- Testing of the functional characteristics on switches
- Assessment of the correct installation of the switches for newly built infrastructure
- Assessment of the correct condition of the switch during infrastructure maintenance
